ETL for Simple Dimension Tables - Project 3 Summary

Overview:

This project focuses on the ETL (Extract, Transform, Load) process to load data into the Date

Dimension table in an OLAP database using SQL Server Integration Services (SSIS). The task

involves extracting data from a CSV file, transforming it to fit the required schema, and loading it into

the AdventureWorks data warehouse.

ETL Process Implementation:

The ETL process consists of several stages:

- 1. Extract:
- The source data is imported from a CSV file containing DateKey and other date-related attributes.
- 2. Transform:
- Convert DateKey from string format to an integer.
- Extract year, month, and day components.
- Create a FullDate column by concatenating extracted date components.
- Convert FullDate to the appropriate date data type.
- Compute additional attributes such as Quarter, EnglishMonthName, EnglishDayName, and

DayOfWeek.

- Determine if the date is a holiday.
- 3. Load:
- The transformed data is inserted into the Date Dimension table in the OLAP database.

SSIS Package Details:

The SSIS package consists of multiple control flow tasks designed to execute the ETL steps in

sequence. The process starts with extracting data from the CSV file, performing transformations

using derived column and conversion tasks, and finally loading the processed data into the destination table.
